

2.4 Release Notes

Comala Checklists 2.4

04 Jun 2019

Comala Checklists 2.4 is a feature update release.

What's New?

Data Center compatibility

Checklists 2.4 has been updated to support Confluence Data Center.

As part of this update Data Centre read only mode is now also supported.

To make sure that users can not add checklists to their pages that will disproportionately use system resources a built hard limit of 1000 pages per checklist has also been added for both data centre and server releases.

Installation/Download

Install through the plugin manager or download from [Atlassian Marketplace](#).

Updates

Updated minimum Confluence compatibility

Starting with Checklists version 2.4, the new minimum version of Confluence that the app is compatible with is Confluence 6.0.1.

Usage Statistics

Usage data will now be sent to a new Comalatech hosted server as well as Google Analytics (from which we are transitioning away). We thank the clients that provide this data to help us improve the product. Usage data gathering can be disabled at any time in the global app configuration screen.
