

add-comment macro

[Where to use it?](#) | [Parameters](#) | [Example](#) | [All examples](#) | [See also](#)

Overview

The `{add-comment}` macro adds a top-level (un-nested) comment to a page or blog post, in much the same way an end-user would.

The comment will be posted as if from the user who caused the event to be fired. In cases where no user was responsible for firing the event (for example, the `pageexpired` event), the comment will be posed as if from an "Anonymous" (no user account) user, even if the Space permissions do not permit anonymous posting.

Where to use it?

Optional.

One or more `{add-comment}` macros can be put in a `{trigger}` macro.

Parameters

Parameter	Required	Default	Notes
<i>macro body</i>	✔		Content of comment: <ul style="list-style-type: none">• Wiki markup – see Confluence Wiki Markup• Plain text• Can use any character set supported by your Confluence server – except some reserved characters• Supports Value References
