

ServiceRocket Scaffolding Forms and Templates app

Overview

This article explains how to integrate ServiceRocket [Scaffolding Forms and Templates app](#) with Comala Document Management.

You will need ServiceRocket Scaffolding Forms and Templates app **version 2.2 or above** and Comala Document Management (formerly Comala Workflows) **version 4.18 or above**.

Workflow Supplier

Scaffolding forms and templates can obtain workflow information using the [Workflow Supplier](#), in much the same way other Suppliers are used.

Value references

Workflows can obtain data from Scaffolds via [Supplier References](#), allowing contents of a Scaffold to dynamically define values within the workflow.

The following data sources are supported:

- [attachment-data](#)
- [date-data](#)
- [excerpt-data](#)
- [list-data](#)
- [number-data](#)
- [text-data](#)

In short, anything that can be accessed by the Scaffold Data Supplier with the `data:FieldName` syntax can be converted to a value reference by wrapping it in @ (at) characters, for example: `@data:FieldName@`

Examples

- [Scaffolding app - Retrieve list-data via supplier reference](#)
