

Upgrade from 5.x to 6.8.1x

Installed	Upgrade to versions
<6.00	6.8.1 or later

JSON Content Properties Population Upgrade Task

The new workflows space report uses Confluence JSON page properties to supply the data to display. These values will normally be updated after each change in the workflow, but on initial upgrade will need to be populated.

This will be done as part of a background upgrade task after the 6.8.1x version of the plugin is installed. If you are updating from 5.x to a version up to and including 6.8.0 please refer to a separate [upgrade notes page](#).

If for any reason this fails (such as an invalid license) the population long running task can be re-run manually by going to the following URL as a global admin.

```
https://<HOSTNAME>/admin/plugins/approvalworkflow/workflowsPopulateJsonProperties.action
```

Active Objects Table for Read Confirmation Storage

Comala Workflows has started to use active objects tables in the Confluence host database. In this release it is just for read confirmation history data, with more likely in future updates. This doesn't require any action from an upgrade point of view, table creation will be automatic. However it should be noted that space exports will now no longer include all related workflow information as they did previously.

Upgrading directly to the latest version

If you are upgrading **directly to the latest version** you do not need to do any interim upgrades.

If you are currently using read-ack macro, you need to run the following script after the upgrade to the latest version.

```
<base-url>/admin/confirmReadConfirmationRecordsMigration.action
```

It will show if any records need to be migrated.
