

Getting Started with Comala Boards

Comala Boards is **Data Center** and **Server** compatible

How can I use boards?

Once you have installed [Comala Boards](#), you can:

- [Create a new page with a board using a Comala Boards Blueprint](#)
- [Add a board to a page](#)
- [Create your own board](#)
- Add [page-cards](#) and [pages](#) to your board
- [View space labels](#) in board layout

Getting started with boards

- [What is a board?](#)
- [SWOT Analysis Board](#)
- [Adding a new board to a page](#)
- [Customizing the board](#)

- [Setting Board Properties](#)

Comala Boards is **Data Center** compatible.

What is a board?

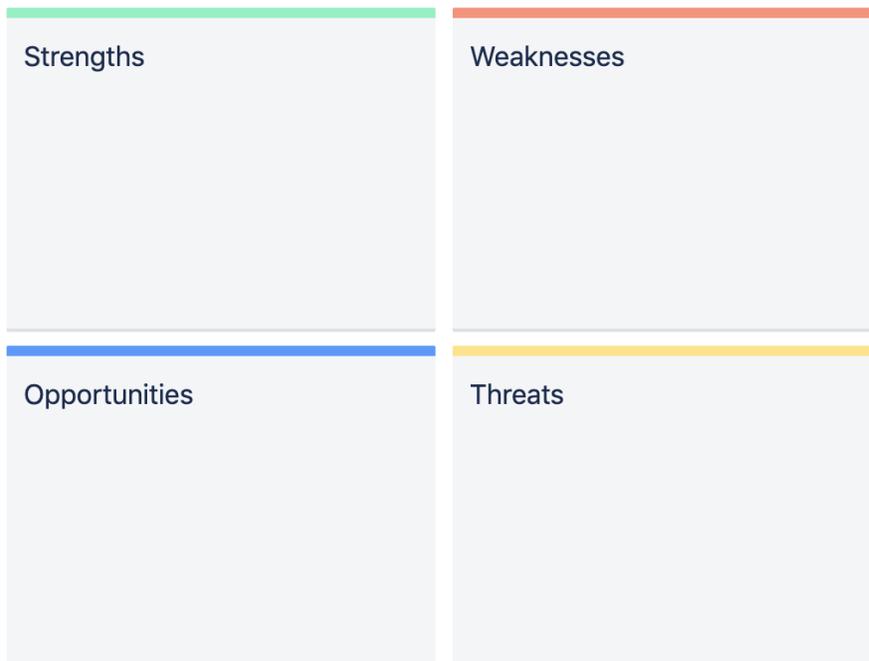

A Comala Board is a fast and effective way for you to brainstorm and visualize your content and ideas.

A board can be embedded into

- an existing page by adding the boards macro or
- a new page when creating a page using a Comala Boards blueprint

There are a number of board templates that can be used to help you get started, such as the SWOT Analysis board.

SWOT Analysis

A board consists of columns into which you can add containers.

Each container has these attributes

- the container name

- the container description
- the labels defined for each container

All the board templates available when [adding a board](#) to a page can be viewed in the documentation [Boards Exchange](#).

SWOT Analysis Board

The SWOT Analysis board has four containers - Strengths, Weaknesses, Opportunities and Threats.

SWOT Analysis ▾

The screenshot shows a SWOT Analysis Board with four containers:

- Strength** (green header): what makes our offer so wonderful. Cards: Ease of use, Unique product.
- Weaknesses** (orange header): Limitations and inhibitors. Cards: Functionality, Visual UI, Training support.
- Opportunities** (blue header): Growth, expansion, changes and audiences. Cards: Bundle, Partners, Aspirational product roadmap.
- Threats** (yellow header): Competition, technology, expectations. Card: New entrants. A dropdown menu is open for 'New entrants' showing 'New entrants' with a 'threat' label and an 'Add card' button.

Board Cards

Within each container, you can add one or more [cards](#).

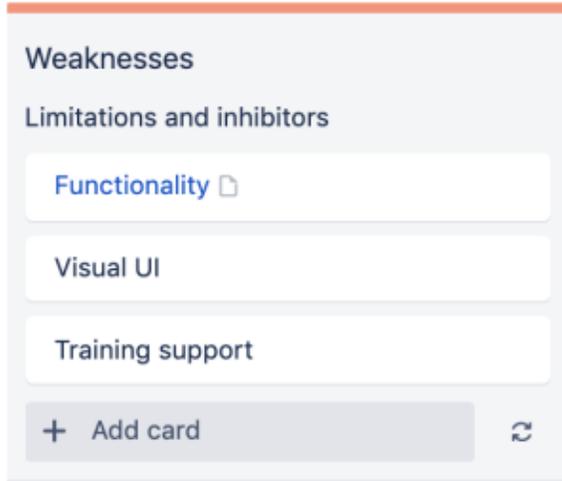

Once added to a board, a card can be moved to different containers on the board. This is done without the need to edit the Confluence page.

Choosing a card will display any labels for the current container and any additional card content.

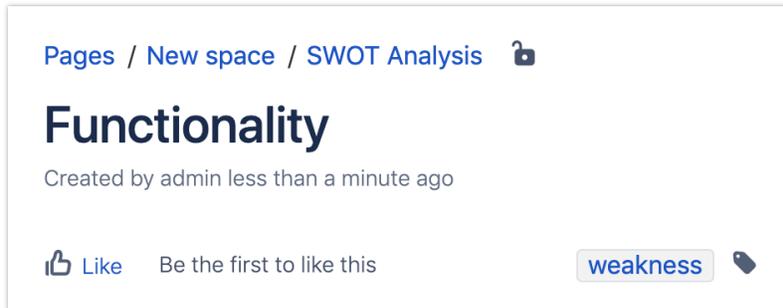

This close-up shows the 'Threats' container with the title 'Threats' and description 'Competition, technology, expectations'. The 'New entrants' card is selected, and its dropdown menu is open, displaying the card title 'New entrants', a list of items: '- indirect competition' and '- direct competition', and a 'threat' label. At the bottom of the dropdown is an 'Add card' button.

Board Pages

Each board can be configured to allow a card to be added as a simple card or as a [page-card](#).

Adding a card as a page-card will automatically create a linked Confluence page.

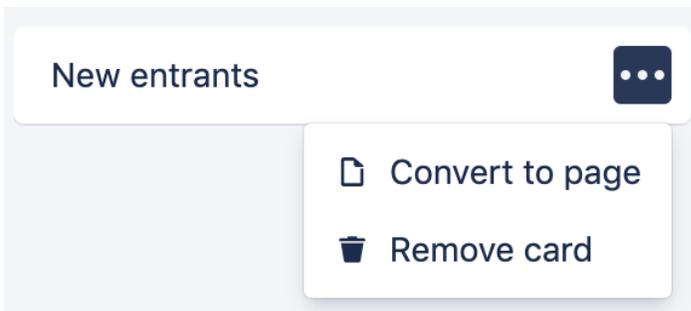

The linked page is displayed in the sidebar navigation.

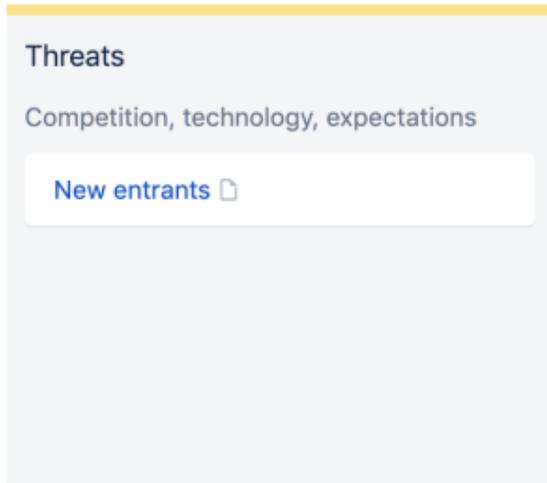

- the page name is the same as the page-card on the board
- the Confluence page is created as a child of the page containing the source board
- any board content for the page-card such as the description is added to the new Confluence page
- the board container labels are added as Confluence page labels

If [pages \(page-cards\)](#) are allowed on the board, any existing card on the board can be [converted to a page-card](#).

The converted card will be displayed on the board as a link to the newly created child page.

Moving the page-card location to a different container on the board will automatically change the labels to those of the new board container.

The labels will change for **BOTH** the **page-card** on the board and the **linked Confluence page**.

i If you

- **remove** the **page-card** from the board this does not delete the child page
- **delete** the **Confluence linked page** this will remove the board page-card from the board

Adding a new board to a page

You can create your own customized Comala Board.

- choose **Edit** your page
- add the **board macro** to your page

- Choose **Create a new board** to [add a new board](#)

Comala Boards — You will insert a board in the current page Close Insert

- Choose the number of rows and columns for your new board by 'scrolling to select' across the displayed grid.

Insert Board Help

Start by defining the size of your canvas; then you can set the titles, labels, colours and icons.

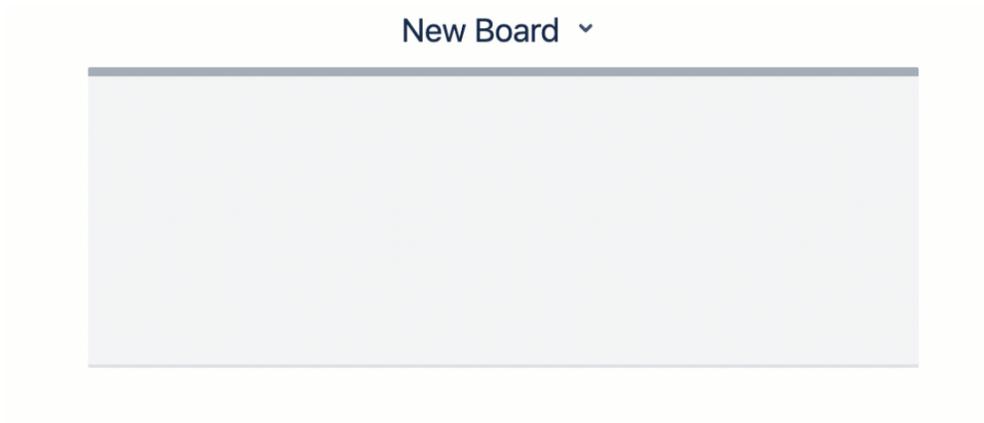

Comala Boards — You will insert a board in the current page Close Back Insert

- Choose **Insert**.

This board macro, currently configured as a single cell board, can be saved to the Confluence page by choosing **Update** (or **Publish** if creating a new page).

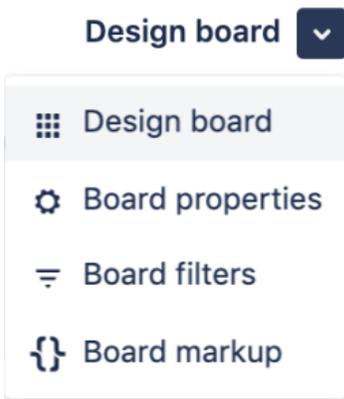

The new board will be displayed on the published page. In this example it is a single container in a single row and single column.

Users can add cards and card-pages to the board on the page. The design and layout of the board can be customized using the [board editor](#).

Customizing the board

A board can be customized using the board editor. Choose the options from the board dropdown menu.

- **Design board** - to edit rows, columns, headers and footers and board containers and their colors
- **Board properties** - to edit board name, board description, match cell heights across rows and/or columns, choose to add cards or card-pages or both, hide or show container descriptions and notification of watchers
- **Board filters** - to display content based on labels, spaces and/or parent

Experienced users can also view and edit the board markup.

Customizing the new board layout

The initial board is a single row, single column with one unnamed container. The layout of the board can be customized using the tools in the **Design** option in the board editor.

- choose **Edit** the Confluence page

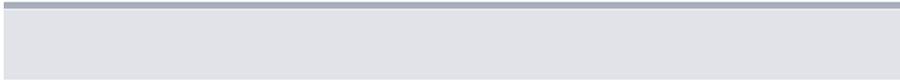

- choose **Edit** the board macro to open the board editor

Adding a container name will automatically add the name as a label for the container.

If you later change a container name you will have to manually edit the label to reflect the new name.

You can also utilize the **board design** tools and the **board properties** option to

- add row and column headers, a container color scheme and an emoji for the board using the [design tools](#)
- add a name for your board in the [board properties](#)

Template for new pages

Templates with variables are not supported

Maximum card load per container

In the board properties you can

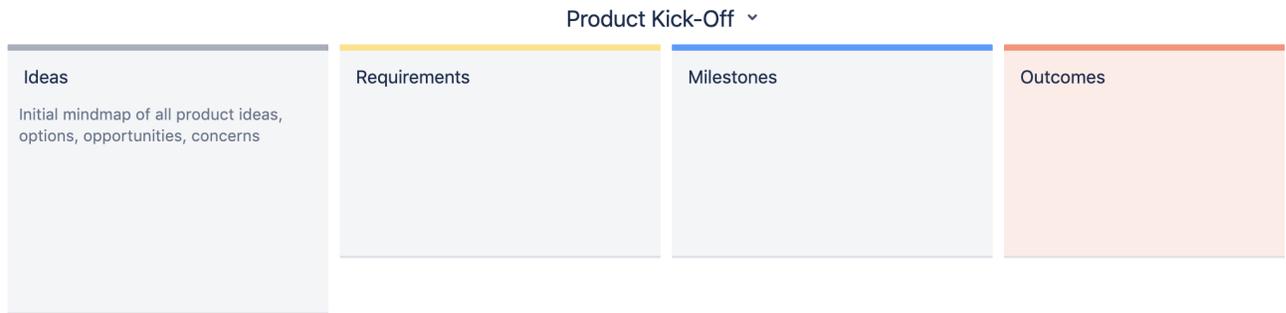

- add or amend the name for the board
- add or edit the board description
- enable or disable checkboxes for card types that can be added to the board
- choose a default page template for the creation of linked board pages
- constrain the number of cards per container

The board properties toolbox icons can be used to

- set the board alignment on the published page as centre or left aligned
- match cell heights across the rows or across the board

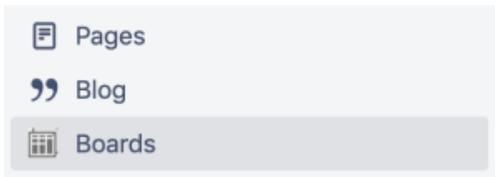

- hide or display container descriptions on the published page
- hide or display multiline text in board cards
- manage notifications to page watchers for board change

You can create a range of individual boards with different containers.

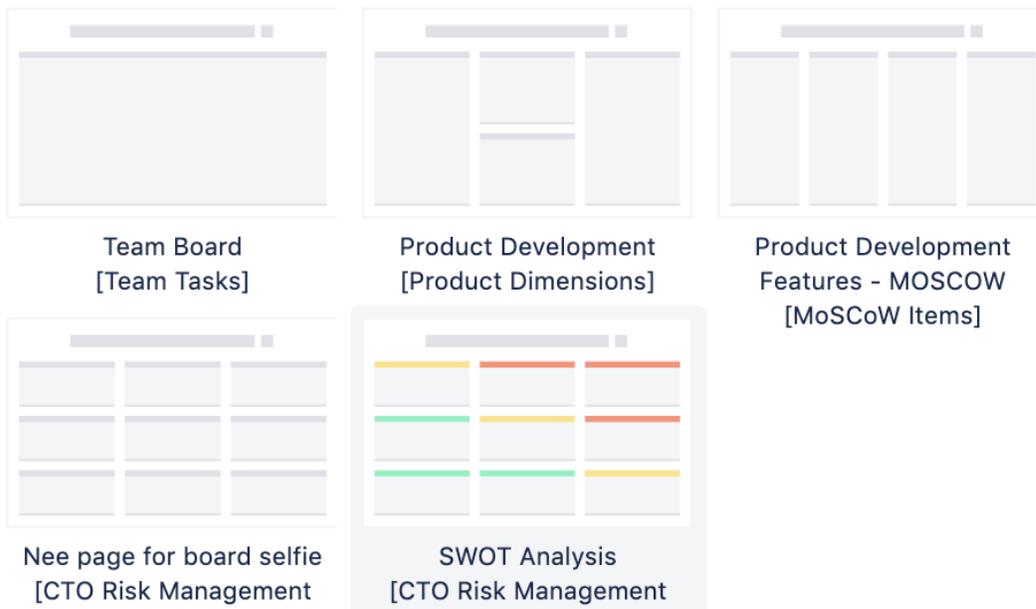

Comala Boards in a space

An overview of all the Comala Boards being used on pages in a space can be displayed using a shortcut menu in the Confluence side bar.

This report displays a visual list of pages in the current space with added boards.
