

Page Property References

Overview

Confluence **Page Properties** can be accessed using [Value References](#).

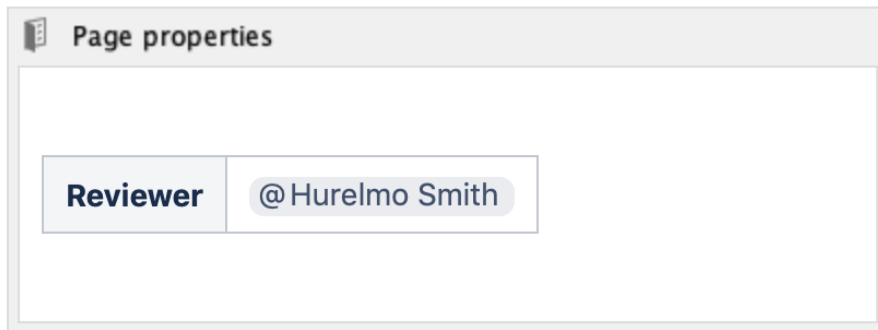

Where can they be used?

They can be used in any macro that supports [Value References](#) or [Conditions](#) – see [Conditions, Content and Value References](#) for a list.

How to use them

First, [define your page properties](#).

For example, here we've defined a property named "Reviewer" with a [user @mention](#) as its value:

You can then refer to that property, by name, in a value reference: `@Reviewer@`

Here's an example workflow using the reference

```
{workflow:Page property}
  {state:Review|approved=Published}
    {approval:Review|user=&@Reviewer@}
  {state}
  {state:Published}
  {state}
{workflow}
```

Only the user defined by the "Reviewer" page property will be able to approve that review, and, due to the `&`, they will automatically be assigned to the review.

You can use other types of value as well, such as text, [Expiry Dates](#) and so on.

Referencing properties on other pages

You can reference properties on other pages by adding the page title, like so: `@Some Page:Reviewer@`

If you want to reference a page in another space, add the [Space Key](#) too, like so: `@SOMEKEY:Some Page:Reviewer@`

All examples

Content by label

There is no content with the specified labels
