Comala Publishing is **Data Center** compatible

Overview

Comala Publishing provides between-space publishing. It lets you keep two spaces in sync: a *draft* space where you can make all the content changes you want, and a *published* space, that displays the content you want users to see.

As a space administrator you can

- publish content in draft spaces, pages, and blogs to published spaces
- track what pages and spaces are in sync
- [publish entire spaces](#) or [single pages](#)
- [copy](#) entire spaces

You can add and apply a Comalatech workflow using one of the [Comala Document Management Family of apps](#) to extend Comala Publishing by automating more elaborated approval processes.

Getting Started

Install the [app](#) and visit [Quick Start](#) to see how to

- [configure the global app permissions](#)
- [link a space for draft content and a space for publishing](#)
- [configure the content to be published](#)

Comala Publishing is **Server** and **Data Center** compatible.
